

Rohak Savani

Mumbai, India | Email | Website and Blog | LinkedIn | GitHub

Summary

Software Engineer with hands-on experience in high-concurrency backend systems, performance optimization and site reliability. Experienced in deep-dive root cause analysis across complex distributed stacks, optimizing APIs for 200k+ users per hour and building solutions that halve six-month delivery cycles. Passionate about clean and secure-by-design software development.

Skills

Languages: Python, JavaScript, TypeScript, C#, Java, Bash, SQL

Libraries & Frameworks: Django, Node.js, Express.js, Next.js, ASP.NET

Databases: PostgreSQL, Redis, MongoDB, InfluxDB, SQLite

DevSecOps: AWS, Linux, Docker, Kubernetes, Wireshark, Nmap

Performance & SRE: Dynatrace, AppDynamics, Grafana, Postman, JMeter, NeoLoad

Miscellaneous: Git, AntigraVity IDE, Atlassian Suite, REST APIs, CI/CD

Professional Experience

Software Engineer – Self-Employed

Mumbai, India | Jul 2025 – Present

Backend Engineering, Security Audits and Workflow Automation

- **Workflow AI Automation:** Manual invoice processing across **500+ monthly logistics emails** was becoming a hassle. To mitigate this, I designed and deployed an automated extraction pipeline using *Python, n8n, Claude, Tesseract OCR*. The effort **eliminated the manual workload entirely**.
- **Security Audit:** An e-commerce platform had undiscovered exposure to potential bad actors. I conducted code and architecture reviews, identified *XSS, CSRF* and *SQL injection* vulnerabilities and delivered hardened configuration recommendations resulting in **improved security posture**.

Quality Engineering Analyst – Accenture

Mumbai, India | Jul 2022 – Dec 2024

Performance Engineer & SRE for a Fortune 500 Global Consumer Electronics Leader

- **API Latency & Throughput Optimization:** At peak Black Friday load, 20k+ orders and 200k+ visitors per hour were hitting a distributed stack of *API Gateway, microservices, SAP, DB* and vendor platforms. As a part of performance improvement initiative, we conducted a deep-dive root cause analysis, traced the latency bottlenecks to their source and drove fixes that produced a **30% throughput increase** (40k to 52k API calls/hr).
- **Real-Time Recommendation Engine:** Optimization recommendations were taking up to 6 months to ship and I felt it was far too slow for the platform's cadence. I identified the gap, ran a feasibility study and independently built a real-time recommendation system using *Node.js, Python, TypeScript, WebPageTest, Sitespeed.io* and *Google CrUX*. As a result, delivery timeline dropped by **50%** (from 6 months to 3 months).
- **Infra & Platform Migration:** The existing *JMeter* setup lacked the scalability and automation coverage we desired. Collaborating on a team-wide migration to *NeoLoad*, we modernized the testing pipelines with improved **CI/CD integration**, enterprise **scalability** and **observability** across B2B and B2C frontends.

Intern – MICM

Mumbai, India | Aug 2021 – Dec 2021

Growth Training Program Trainee

- **Enterprise Module Development:** Assisted in delivering ERP and CRM solutions to academic institutions, programming functional modules in *C#, ASP.NET* and *Entity Framework*. Collaborated in a 4-person *Agile* team to build a **standalone PoC** validating feature viability for core platform integration.

Projects

Deterministic Credential Retriever – CLI Tool | Zero-Trust, Python, argparse, hashlib

[Source](#)

- Storing passwords creates an attack vector. This tool removes it. A *stateless, logless* CLI that deterministically derives credentials through recursive multi-stage **SHA3-256** hashing. No storage, no database, nothing to breach. Built on **Zero Trust Model (ZTM)**, ensuring authentication without persistence. Thus, credential harvesting risk is eliminated by design.

Comparative CMS Architectures – Research Project | Backend Benchmarking, Django, Express.js

[Source](#)

- Two parallel full-stack content management system implementations: *Express.js* on *MongoDB* and *Django* on *PostgreSQL*, built specifically to benchmark **middleware overhead, ORM query efficiency** and **developer ease**. Findings and trade-offs documented in the source.

Certifications & Education

• **AWS CLF-C02** – Amazon

[Certificate](#) (Valid through Jan 2029)

• **Security+** – CompTIA

In Progress

• **Bachelor of Science, Computer Science** – Mithibai College, University of Mumbai

CGPA: 8.13 | Jul 2019 – Apr 2022
